

B1. Front-end issues and fixes

Accessibility

- **Missing ``lang`` attribute on ``<html>``**
 - **Issue:** Screen readers may not know the page language.
 - **Fix:** Add ``lang="en"`` to the ``<html>`` element.
- **Images lack ``alt`` text**
 - **Issue:** ``<img>`` elements have no alternative text for screen readers, and it also hurts accessibility when images fail to load.
 - **Fix:** Add descriptive ``alt`` attributes, e.g. ``alt="Company logo"`` and an appropriate description for the hero image. If the hero image is purely decorative, use ``alt=""``.
- **Navigation uses ``<div>`` elements**
 - **Issue:** ``<div onclick="...">`` is not keyboard-accessible by default and doesn't provide semantic navigation to assistive technologies.
 - **Fix:** Use semantic ``<nav>`` and ``<a href="/services">Services</a>`` links instead.
- **CTA uses a ``<div>``**
 - **Issue:** The "Get in touch" element isn't a proper interactive control and cannot reliably be accessed using the keyboard.
 - **Fix:** Use ``<a href="/contact">Get in touch</a>`` and style it as a button.
- **No visible indication of keyboard focus**
 - **Issue:** If CSS removes or doesn't provide focus styles, keyboard users may not know which element is selected.
 - **Fix:** Ensure links/buttons have a clear ``:focus`/`:focus-visible`` style.
- **Heading hierarchy**
 - **Issue:** The page uses ``<h2>`` as its apparent main page heading.
 - **Fix:** Use an ``<h1>`` for the primary page heading, with lower-level headings following it logically.

SEO

- **Very weak ``<title>``**
 - **Issue:** "Home" provides little information to search engines or users.
 - **Fix:** Use a descriptive, keyword-relevant title, e.g. ``"Web Development & Design Services | Company Name"``.
- **Missing meta description**
 - **Issue:** There is no description to help search engines understand/summarise the page.
 - **Fix:** Add a concise ``<meta name="description" content="...">``.

- **No semantic navigation**
 - **Issue:** Navigation implemented with generic `

` elements provides less semantic meaning.
 - **Fix:** Use `` containing proper `` elements.
- **Poor heading structure**
 - **Issue:** The main content starts with an `

` rather than an ``.
 - **Fix:** Change the main page heading to `

`.
- **Images lack descriptive `alt` attributes**
 - **Issue:** Search engines receive less contextual information about meaningful images.
 - **Fix:** Add useful, descriptive `alt` text where appropriate.
- **No viewport meta tag**
 - **Issue:** The page may not render correctly on mobile devices.
 - **Fix:** Add:

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

Performance

- **jQuery is loaded unnecessarily unless `slider.js` requires it**
 - **Issue:** jQuery adds an additional dependency and download/parse cost.
 - **Fix:** Remove jQuery if `slider.js` doesn't need it, or rewrite the slider using modern vanilla JavaScript.
- **JavaScript is loaded in the ``**
 - **Issue:** Normal scripts can block HTML parsing while they download and execute.
 - **Fix:** Use `defer`:

```
<script src="/js/slider.js" defer></script>
```

If jQuery is required, defer it too.
- **Hero image may be unnecessarily large**
 - **Issue:** Large JPEGs can significantly increase page load time, particularly on mobile.
 - **Fix:** Compress and appropriately resize the image; use modern formats such as WebP/AVIF where supported.
- **No responsive image handling**
 - **Issue:** A single large hero image may be downloaded even on small screens.
 - **Fix:** Use `srcset`/`sizes` or a `` element to provide appropriately sized images.
- **No image dimensions specified**
 - **Issue:** The browser may not reserve space for the image, potentially causing layout shifts.
 - **Fix:** Specify `width` and `height` attributes (or use CSS with an appropriate aspect ratio).
- **CSS is loaded after JavaScript**

- **Issue:** While not necessarily a major performance problem, CSS should generally be discovered early because it controls rendering.
- **Fix:** Put the stylesheet before scripts in the ``<head>``.
- **External jQuery dependency**
 - **Issue:** Loading jQuery from an external CDN introduces another network dependency.
 - **Fix:** Prefer native JavaScript where practical, or ensure the CDN resource is appropriately cached and loaded efficiently.

Quick priority order

1. Replace clickable ``<div>`'s with semantic ``<a>`' links.
2. Add ``alt`` text to images.
3. Add ``<html lang="en">`` and the viewport meta tag.
4. Change the main heading from ``<h2>`` to ``<h1>``.
5. Add a meaningful ``<title>`` and meta description.
6. Add ``defer`` to JavaScript.
7. Optimise the hero image and use responsive image sizing.
8. Remove jQuery if it isn't actually required.
